> Q1. How many genes are in this dataset?

There are 38694 genes in this data set.

> Q2. How many 'control' cell lines do we have?

There are 4 control cell lines.

Extract and summarize the control samples

```
control <- metadata[metadata$dex == "control",]
control.counts <- counts[,control$id]
control.mean <- rowMeans(control.counts)
head(control.mean)
```

```
ENSG00000000003 ENSG00000000005 ENSG00000000419 ENSG00000000457 ENSG00000000460
         900.75            0.00          520.50          339.75           97.25
ENSG00000000938
           0.75
```

Extract and summarize the treated samples

```
treated <- metadata[metadata$dex == "treated",]
treated.counts <- counts[,treated$id]
treated.mean <- rowMeans(treated.counts)
head(treated.mean)
```

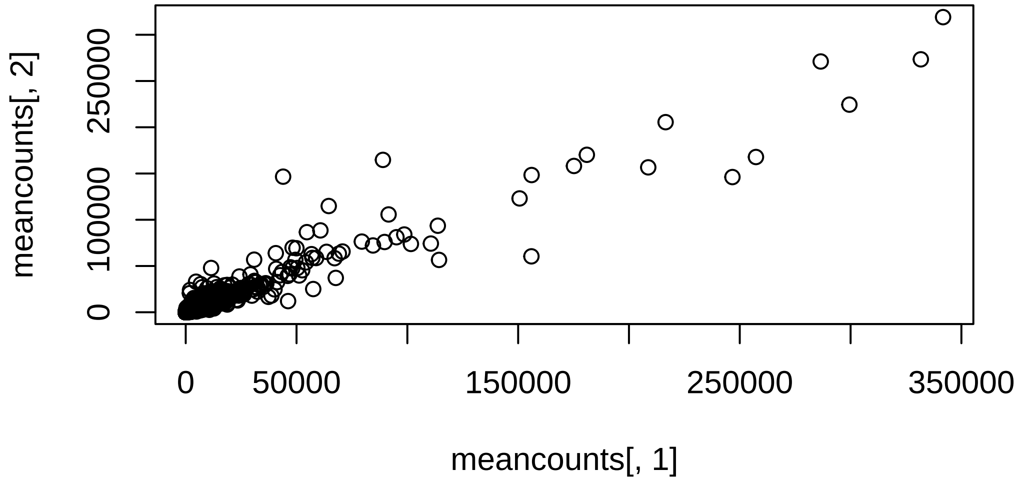
```
ENSG00000000003 ENSG00000000005 ENSG00000000419 ENSG00000000457 ENSG00000000460
         658.00            0.00          546.00          316.50           78.75
ENSG00000000938
           0.00
```

Store these results together in a dataframe called mean counts.

```
meancounts <- data.frame(control.mean, treated.mean)
```

Lets make a plot to explore the results a little.

```
plot(meancounts[,1], meancounts[,2])
```

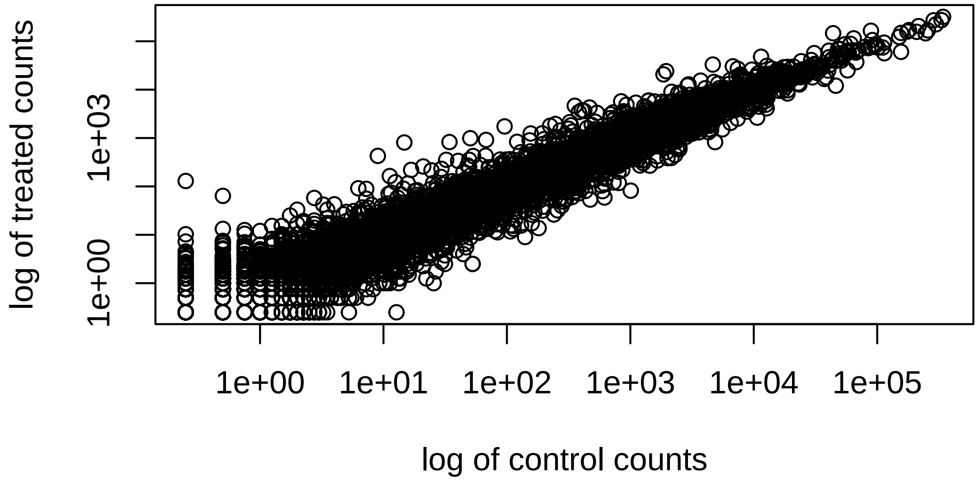


Make log-log plot to draw out this skewed data and see what is going on.

```
plot(meancounts[,1], meancounts[,2], log="xy", xlab = "log of control counts",
     ylab = "log of treated counts")
```

```
Warning in xy.coords(x, y, xlabel, ylabel, log): 15032 x values <= 0 omitted
from logarithmic plot
```

```
Warning in xy.coords(x, y, xlabel, ylabel, log): 15281 y values <= 0 omitted
from logarithmic plot
```



Log2 transfirmation has a nice property, where no change will make the log2 value zero, doubling will lead log2 to be 1 and halving will lead it to be -1.

Add log2 fold change column to our results so far.

```
meancounts$log2fc <- log2(meancounts$treated.mean/meancounts$control.mean)

# To get rid of NaN:

# says where the count is 0
zero.vals <- which(meancounts[,1:2]==0, arr.ind=TRUE)
```

```r
to.rm <- unique(zero.vals[,1])
# removes genes with 0 counts
mycounts <- meancounts[-to.rm,]
head(mycounts)
```

```
                control.mean treated.mean      log2fc
ENSG00000000003       900.75       658.00 -0.45303916
ENSG00000000419       520.50       546.00  0.06900279

ENSG00000001036      2327.00      1785.75 -0.38194109
```

> How many genes are remaining?

There are 21817 genes remaining.

Use fold change to see up and down regulated genes.

```r
up.ind <- mycounts$log2fc > 2
down.ind <- mycounts$log2fc < (-2)
```

DESeq2 analysis

```r
#load up DESeq2
library(DESeq2)

dds <- DESeqDataSetFromMatrix(countData=counts,
                              colData=metadata,
                              design=~dex) # design - which col to look at
```

```
converting counts to integer mode
```

```
Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in
design formula are characters, converting to factors
```

We can get some basic summary tallies using the `summary()` function.

```
summary(res, alpha = 0.05)
```

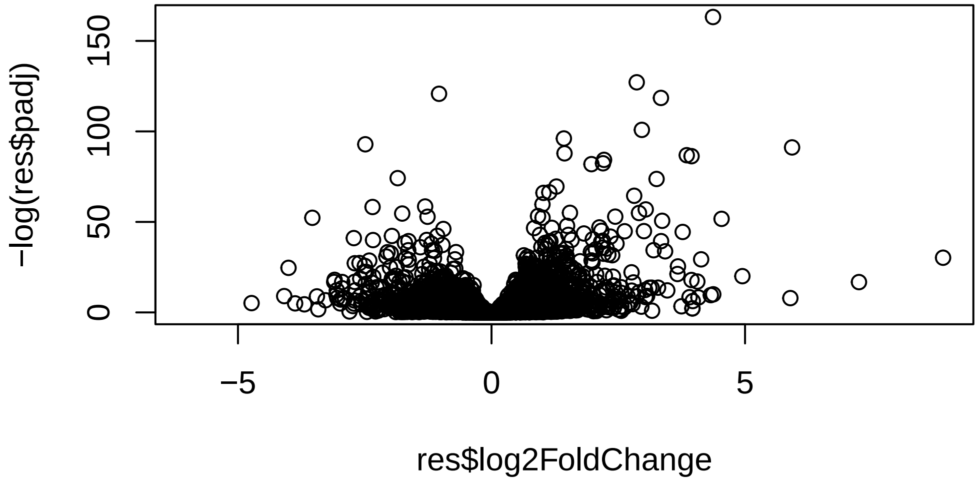
```

out of 25258 with nonzero total read count
adjusted p-value < 0.05
LFC > 0 (up)       : 1242, 4.9%
LFC < 0 (down)     : 939, 3.7%
outliers [1]       : 142, 0.56%
low counts [2]     : 9971, 39%
(mean count < 10)
[1] see 'cooksCutoff' argument of ?results
[2] see 'independentFiltering' argument of ?results
```

Volcano Plot

Let's make a summary plot of our results.

```
plot(res$log2FoldChange, -log(res$padj))
```

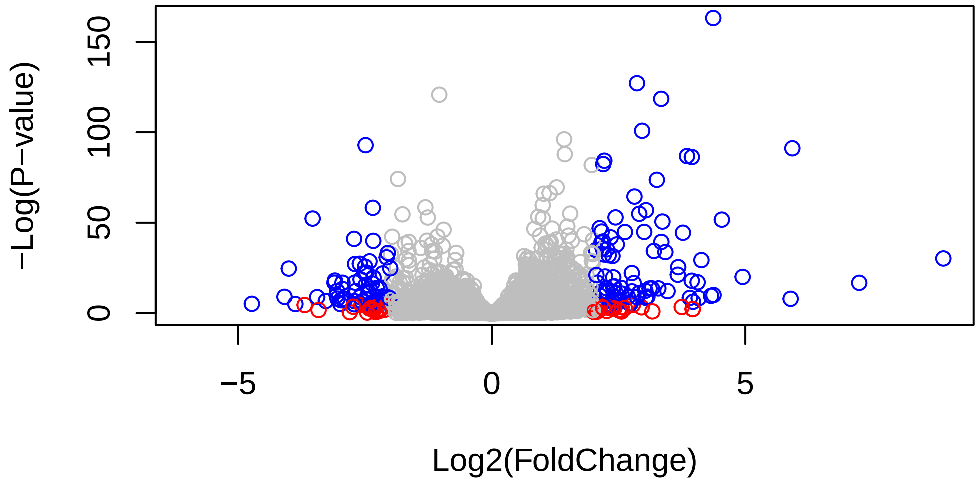


Let’s add colors:

```
# Setup our custom point color vector
mycols <- rep("gray", nrow(res))
mycols[ abs(res$log2FoldChange) > 2 ]  <- "red"

inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

# Volcano plot with custom colors
plot( res$log2FoldChange,  -log(res$padj),
 col=mycols, ylab="-Log(P-value)", xlab="Log2(FoldChange)" )
```



Finish for today by saving our results.

```
# write.csv(res, file = "DESeq2_results.csv")
```
